

# VM450 & VE450

## Quality Function Deployment

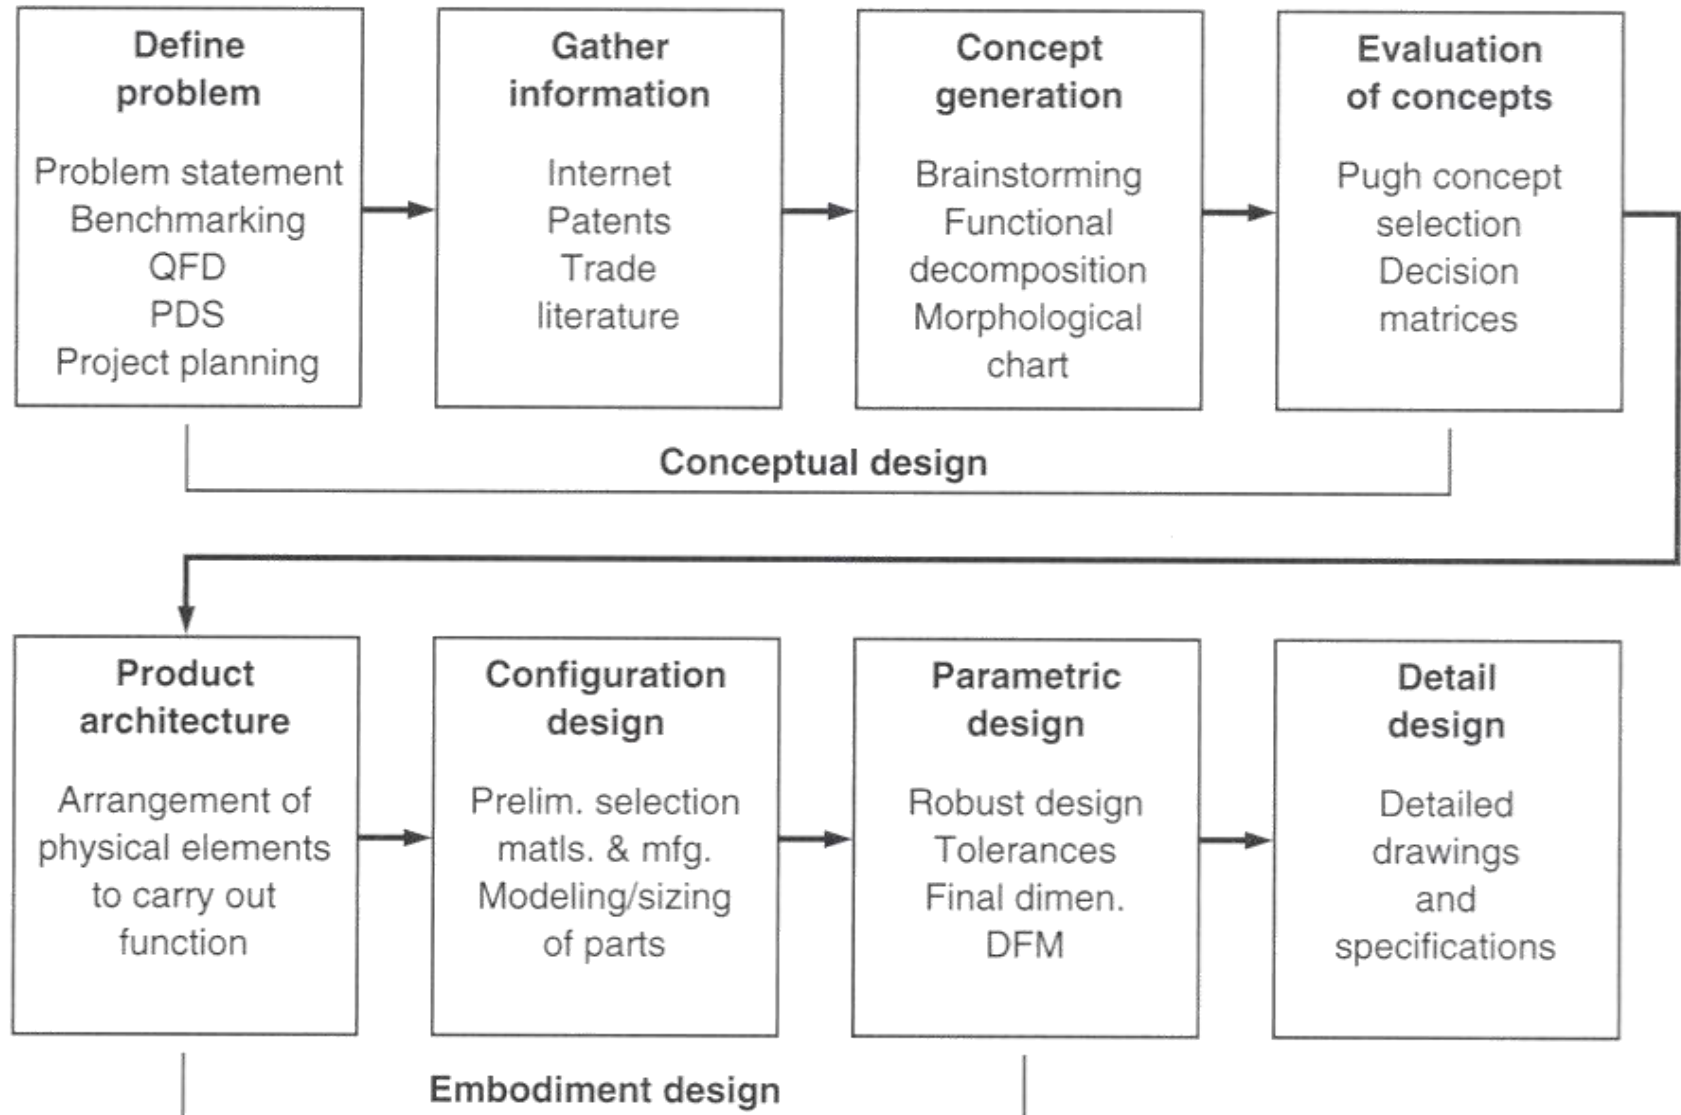

# Outline

- Learn to interpret **House of Qualities (HOQ)**
- Understand how **Customer Requirements (CRs)** feed into the HOQ to help identify **Engineering Characteristics (ECs)** and **Product Design Specifications (PDS)**
- **QFD is method to achieve PDS**
- Create drafts of a HOQ for your projects

# Product Development Process

# QFD and Why

- QFD (Quality Function Deployment) is a “method to *transform user demands into design quality*, to *deploy the functions forming quality*, and to *deploy methods for achieving the design quality* into subsystems and component parts, and ultimately to *specific elements of the manufacturing process*.” – John R. Hauser
- You need to bring the “customer’s voice” into the product development process for success
  - ✧ Customers don’t speak in engineering terms
  - ✧ Customers don’t always articulate their wants

# QFD's House of Quality

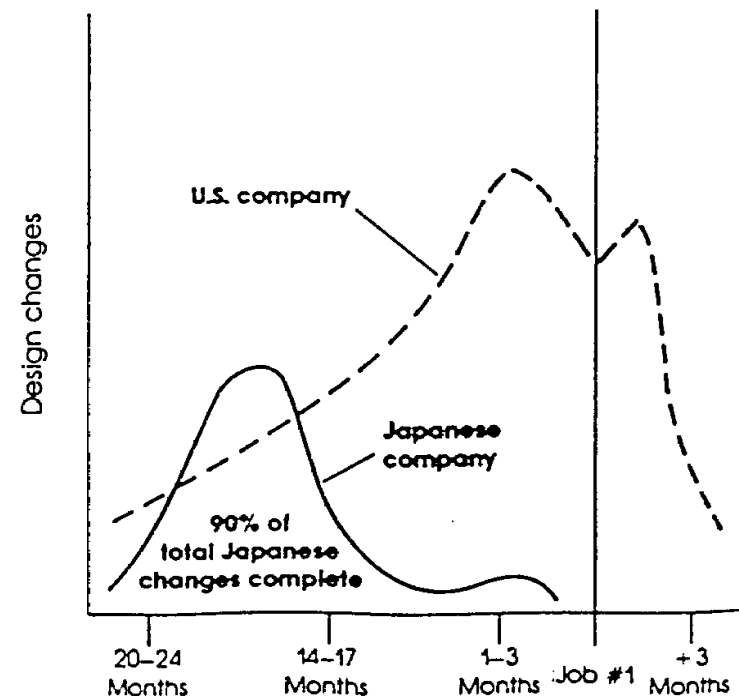

- House of Quality is the QFD's most popular method, most often used by industry
- Conversion of customer requirements into product engineering characteristics

		Voice of the Company									
		Enterprise Product Development Capabilities									
		Business Capture	Quality Processes	Project Management	Technology Development						
Customer Importance	Effective proposals that meet or exceed customers' needs	↑	↑	○	↑	↑	↑	○	↑	↑	○

How Much	Pre-positioned technologies	○	↑	↑	↑	↑	↑	○	↑	↑	○
	Produce innovative solutions that work	0.167	●	●	●	●	●	○	●	●	●
	Quality of product	0.167		●	●	●	●	○	●	●	●
	Company that is open, honest, understanding of customer needs	0.167	●					○	●		
	Effective customer contact	0.167	●		●			○			○
	Want products on-time	0.167				○	○	○			○
Organizational Difficulty (10=difficult)	Target program cost performance	0.167	△	●	●			○			○
	Proposal directive draft reviewed before RFP release	7	9	7	3	3	7	3	9	9	1
	PTW established before proposal team assemblies	7	9	7	3	3	7	3	9	9	1
	Apply Baldrige criteria, ISO 9001, 14001 compliance	7	9	7	3	3	7	3	9	9	1
	Lifecycle cost trades completed before proposal completion	7	9	7	3	3	7	3	9	9	1
	System-level DFSS analysis performed prior to 1st reqts review	7	9	7	3	3	7	3	9	9	1
Weighted Importance	External process initiatives piloted prior to rollout to program areas	7	9	7	3	3	7	3	9	9	1
	2+ company teams on system integ. team (at least 4 tly mgs)	7	9	7	3	3	7	3	9	9	1
	50% predictive metrics in use	7	9	7	3	3	7	3	9	9	1
	2 SLOC/hr (thru N&V) with less than 10 defects/KSLOC	7	9	7	3	3	7	3	9	9	1
	RM Plan developed with proposal, handling approaches followed	7	9	7	3	3	7	3	9	9	1
	Baseline review within 30 days of ATP	7	9	7	3	3	7	3	9	9	1
Relative Importance	Quality deployment -> function deployment -> mechanism	7	9	7	3	3	7	3	9	9	1
	All corporate entities contracted thru development stages	7	9	7	3	3	7	3	9	9	1
	Key characteristics coupled to development plans	7	9	7	3	3	7	3	9	9	1
		7	9	7	3	3	7	3	9	9	1
		7	9	7	3	3	7	3	9	9	1
		7	9	7	3	3	7	3	9	9	1

- Incorporates the voice of the customer in the designs.
- Prevent getting locked on preconceived concepts before fully understanding it.
- Identify potential challenges to achieve customer requirements.
- Reduce design changes later in the design process

**Japanese automaker with QFD made fewer changes than U.S. company without QFD**

QFD Chart

# Example: Automotive Bumper

- Looks good
- Holds license plate
- Resists dents
- Protects head lights
- Doesn't rust
- Last a long time
- Inexpensive
- Protects fender/hood

Not Quantitative!

# Engineering Characteristics

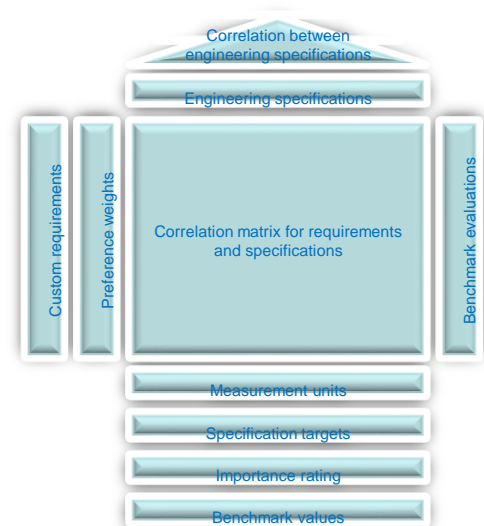

- Yield strength [Pa]
- Young's modulus [Pa]
- Mounting hole separation [m]
- Plating thickness [mm]
- Effective spring constant [N/m]
- Cross-section moment of inertia [m<sup>4</sup>]
- Weight [kg]
- Maximal deflection [mm]
- Cost [RMB]

[illegible]

# Steps of QFD

- Identify the customers
- Determine customer requirements (CR)
- Determine the weights for CR
- Benchmark the competitions against CR
- Generate engineering specifications (ES)
- Correlate CR to ES
- Importance ratings
- Cross-correlate ES
- Benchmark the competitions against ES
- Set the targets for ES

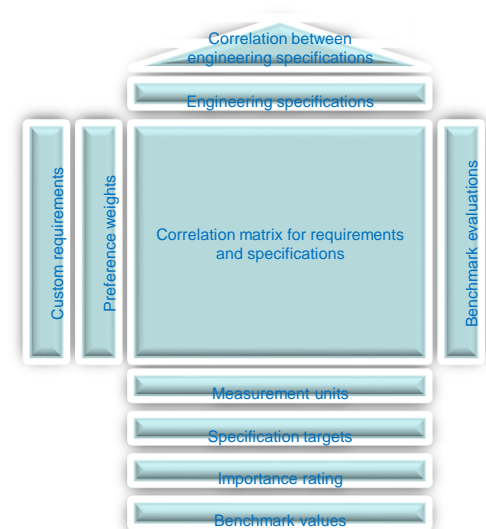

# Step 1: Identify Customers

- What is the target market?
- Who is the consumer?
- Who is the user?
- Who will spread the words?

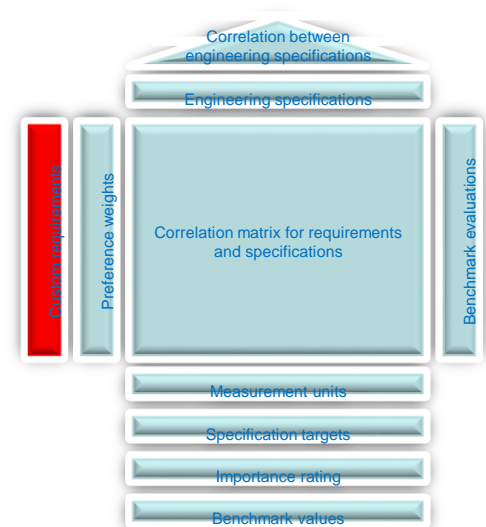

# Step 2: Determine CR

- Customer Requirements (CR) can be determined by
  - \* Customer/market survey
  - \* Customer/focus group interview
  - \* Studying products in use

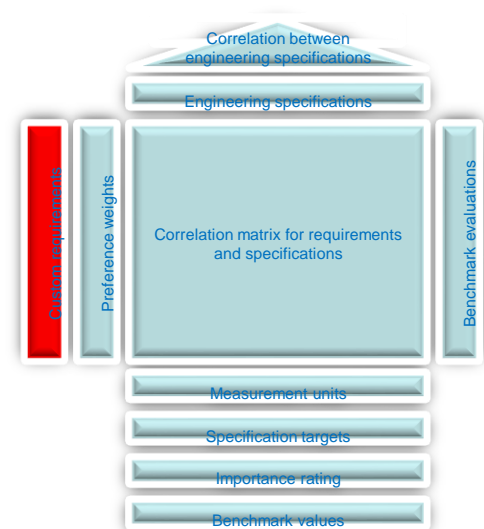

# Step 2: Determine CR

- Customer Requirements can be qualitative or quantitative
  - \* *Function*
  - \* *Shape/Size*
  - \* *Appearance/Aesthetic*
  - \* *Life*
  - \* *Cost*
  - \* *Manufacturing/Assembly*
  - \* *Safety/Environmental*
- Quantitative CR can also be listed as engineering specifications (ES)

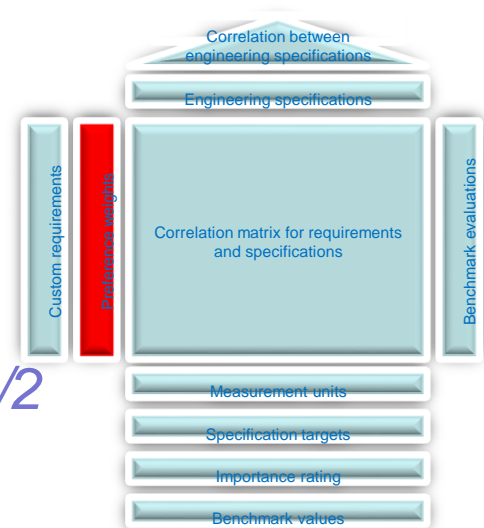

# Step 3: Determine Weights for CR

- Different customers have different priorities
  - ✧ Rank customers according to importance to you
  - ✧ Interview/survey the importance of each CR
  - ✧ Direct ranking
  - ✧ Binary comparison (yes or no)
    - ✧ Make a table with  $n$  rows for requirements and  $n(n-1)/2$  columns for comparison scores
    - ✧ Compare requirements  $j^{\text{th}}$  and  $k^{\text{th}}$ 
      - Use a “1” for the more important and a “0” for the less important and fill in the appropriate column
    - ✧ Sum across the rows and divide by  $n(n-1)/2$

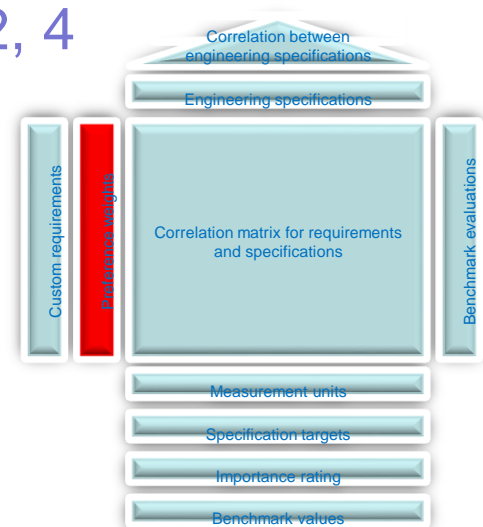

# Step 3: Determine Weights for CR

- Different customers have different priorities
  - ✧ Rank customers according to importance to you
  - ✧ Interview/survey the importance of each CR
  - ✧ Direct ranking
  - ✧ Binary comparison (yes or no)
    - ✧  $n = 4$  rows,  $n(n-1)/2 = 6$  columns
    - ✧ Order of importance: Requirements 3, 1, 2, 4

Requirement 1	1	0	1				2	33%
Requirement 2	0			0	1		1	17%
Requirement 3		1		1		1	3	50%
Requirement 4			0		0	0	0	0%
							6	100%

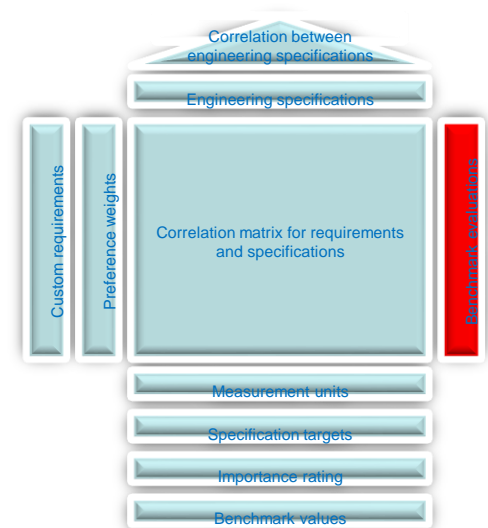

## Step 4: Benchmark Competitions against CR

- Identify one or more “benchmark” products that serve identical or similar customer requirements
- Evaluate them against each customer requirement as:
  - \* 1 = doesn’t satisfy at all
  - \* 2 = satisfies “slightly”
  - \* 3 = satisfies “somewhat”
  - \* 4 = satisfies “mostly”
  - \* 5 = satisfies perfectly
- Reveals areas for improvements

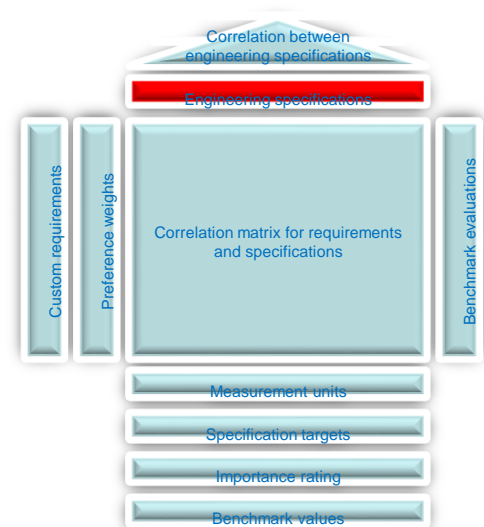

# Step 5: Generate ES

- Engineering Specifications are quantifiable measures that design engineer may specify/control to meet customer requirements
- Must have appropriate units
  - ✱ *But values have been set yet at this point.*
- Must cover all customer requirements
- For CR = “durable,” ES can be:
  - ✱ Average life to failure (years)
  - ✱ Fraction that survive > 10 years (%)
  - ✱ Breaking impact (G)
  - ✱ Failure load (N)
  - ✱ Mean cycles to failure (turns)

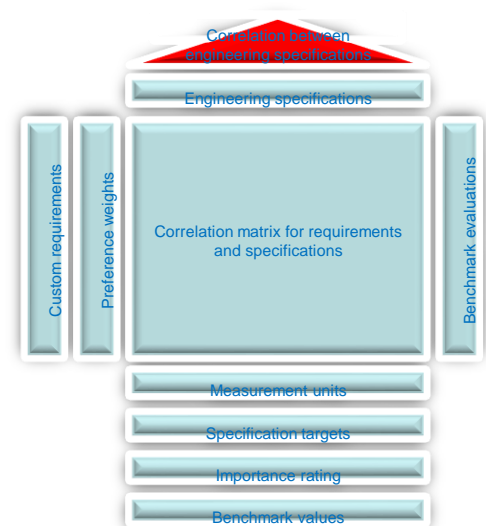

# Step 6: Cross Correlate ES

- Changing one engineering specification can affect others
- For each pair of specifications, enter correlation value:
  - \* ++ = strongly positive
  - \* + = medium positive
  - \* - = medium negative
  - \* -- = strongly negative
  - \* Blank = totally unrelated
- Reveals potential trade-offs

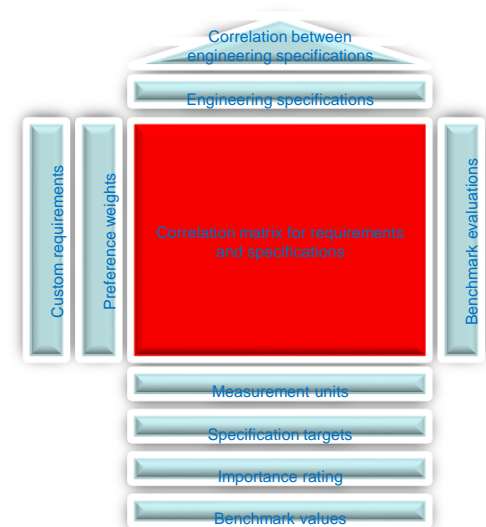

# Step 7: Correlate CR to ES

- For each pair of a specification & a requirement, enter correlation value:
  - \* 9 = strongly related
  - \* 3 = somewhat related, *where 3 is not a typo*
  - \* 1 = weakly related
- **Reveals CR uncovered by ES**
  - \* Each row (CR) must have at least one “9”
  - \* Otherwise the CR cannot be satisfied by an ES, must add new ES that is “9” to the CR

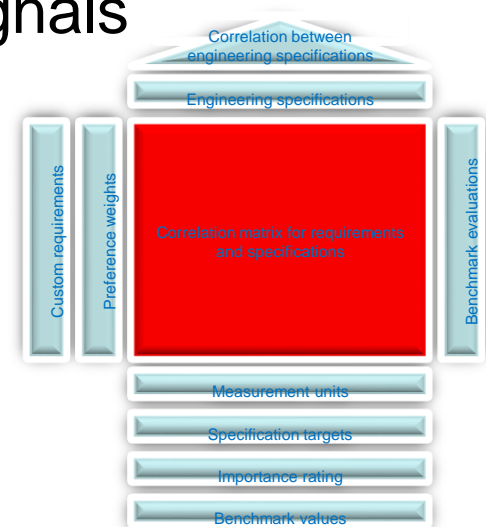

# Step 7: Correlate CR to ES

- Reveals CR uncovered by ES

- ✧ An empty row signals that no ESs exist to meet the CR
- ✧ An empty ES column signals that the characteristic is not pertinent to customers.
- ✧ A row without a “strong relationship” to any of the ESs highlights a CR that will be difficult to achieve.
- ✧ An ES column with many relationships signals that it is really a cost, reliability, or safety item that must be always considered.
- ✧ An HOQ displaying a diagonal matrix (1:1 correspondence of CRs to ESs) signals that the ESs may not yet be expressed in the proper terms

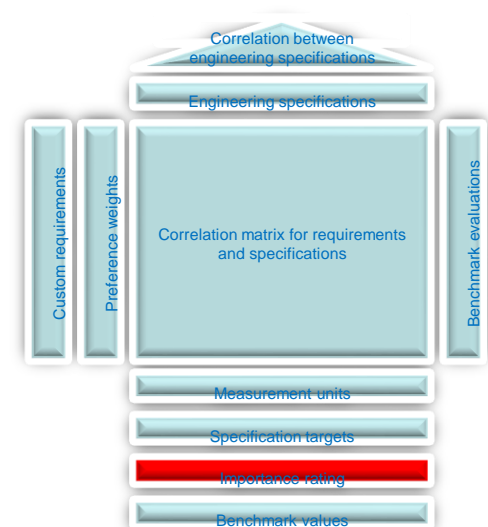

# Step 8: Importance Rating

- Based on correlation between CR and ES
  - \* Absolute Importance is the sum of each column
  - \* Relative Importance is normalized row above
- ES can be ranked
  - \* ESs with higher relative importance is CTQ ESs (Critical To Quality)
  - \* Some CTQ ESs should be treated as constraints.

Hinge stays together	4	3	3			9	3
Waterproof	4	3			3	1	
Absolute Importance		102	130	70	120	111	56
Relative Importance %		17.3	22.1	11.9	20.4	18.8	9.5
Rank Order of ECs		4	1	5	2	3	6

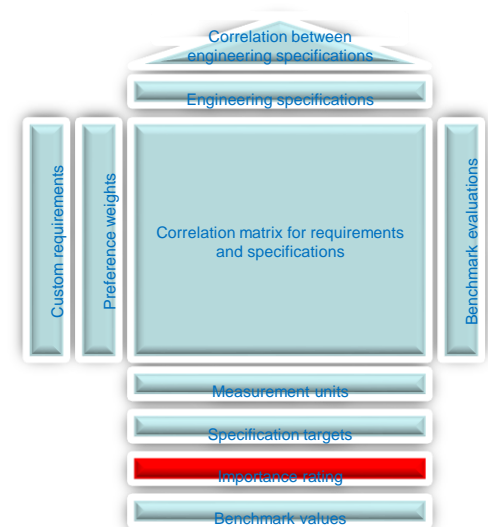

# Step 8: Importance Rating

- CTQ ESs are identified from CR Input
  - ✧ ESs with the highest ranking
  - ✧ Consider if they are really constraints on design feasibility
  - ✧ Require designer attention
  - ✧ Should become *Selection Criteria* for later evaluating alternative designs
- The lowest-ranking ESs
  - ✧ Some design freedom.
  - ✧ Can be set to reduce cost or to preserve another design objective
  - ✧ If low-ranking ESs are not correlated to CTQ ESs, they can be set first

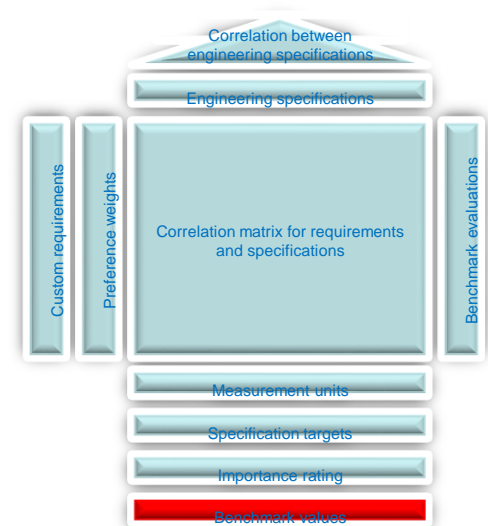

## Step 9: Benchmark Competitions Against ES

- Enter the performance (*values*) of each benchmark product for each engineering specifications
- May require “reverse engineering” or “informed guess”
- Leave blank if unknowns

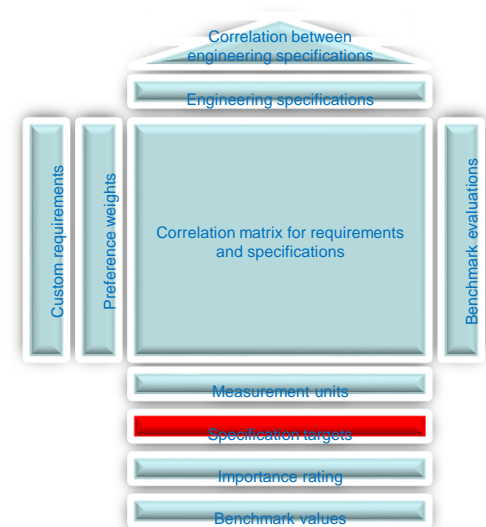

# Step 10: Set Targets for ES

- Enter targets for each engineering specification as:
  - ✧ Specific value
  - ✧ Range of values
  - ✧ Maximize/minimize
- Pay attention to CTQ ESs
- Be reasonable: can't defy laws of physics, materials properties, economic constraints, etc.
- Be realistic, especially if the state-of-the-art exists

# QFD House of Quality: Strengths

- Provides enhanced customer satisfaction
  - \* Voice of the customer is covered
  - \* A robust process
- Provides faster responses to market
  - \* Reduce rework of development
  - \* Create team agreement and commitment
- Reduces Costs
  - \* Competitive benchmarking
  - \* Concurrent engineering
- Increases variety and flexibility

# QFD House of Quality: Weakness

- Targets set based on House of Quality alone can be unrealistic
- HOQ's correlation between Engineering Characteristics is inadequate to reflect the tradeoffs correctly
- Difficult coming to consensus
- Demanding and time consuming
- Complexities cause ineffectiveness

# Summary

- Transforms qualitative wishes to quantitative goals
- Discourages “diving into design”
- Prevents premature “lock on” to a preconceived concept
- Can be applied to problems and sub-problems
- Suitable for customer-driven product development
- Unsuitable for developing “surprise” products
